Subject: DW Wells Located along San Juan River

Corine,

The only water system adjacent to the San Juan River is located at Montezuma Creek, Utah (Montezuma Creek-NTUA, PWSID #NN4903018). The wells are located about 285 feet north from the center of the river. We estimated the distance (via Google Earth) from Durango, Colorado to Montezuma Creek following the river to be about 136 miles (some meandering included).

The system has 3 alluvial wells which are 334', 431' and 360'.

The likelihood of any impacts to the groundwater sources at this site from this spill is low.
